Knuth Golf's High Heat Metalwoods Featured In Colorado Avid Golf's Holiday Gift Guide

BONITA, CA (December 12, 2016) – The award-winning High Heat metalwoods from Knuth Golf are featured in this month's Holiday Gift Guide by Colorado Avid Golfer magazine.

The magazine editors called High Heat's products "genuinely some of the best clubs we've ever hit."

They added: "We gushed over the driver in [January 2015](#) after trying it at the PGA Show and [lauded the fairway woods and hybrids in February](#) of this year. Dean Knuth uses a titanium face, steel body and silver-based adhesive to bond the two together, and somehow manages to create a combination of feel, sound, forgiveness and power that we haven't found anywhere else. The fairway woods are available in 3-wood or 5-wood lofts and come fitted with Aldila or Fujikura shafts."

Colorado Avid Golfer editor Jon Rizzi is a big fan of the Knuth line of metalwoods overall. His magazine named the High Heat Driver as THE best golf product of 2015.

"Dean Knuth, nicknamed the Pope of Slope for inventing the USGA's Course Rating and Slope Systems, designed High Heat specifically for amateur golfers because they have different swing speeds and performance needs than golf pros," said Rizzi. "And High Heat out performs the major brands in every way except for marketing . . . High Heat delivers as advertised."

Rizzi's magazine is not alone in its praise of the High Heat products, as many other media outlets have ranked the Knuth Golf products the best in their categories in recent months. The list includes the media-based International Network of Golf naming the High Heat Driver as the winner of the 2015 Product Ingenuity category in its annual Industry Honors awards and as the Conference Best Product at the ING Spring Conference in May. Many of the media comments are posted on the KnuthGolf.com website.

Knuth, who spent 16 years as Senior Director at the USGA, designed his metalwoods specifically for amateurs of all skill levels. The deeper and lower Center-of-Gravity (CG) makes the High Heat driver, fairway woods and hybrids easier to hit because the CG angle is nearly 33% larger than the average of the leading models offered by all major brands.

High Heat's 3-wood and hybrid are easier to get the ball up in the air. They also feature a Beta titanium cup face, providing a significantly increased spring-like or trampoline effect across the entire face for extra distance and increased forgiveness compared to traditional steel faces, which are in all major brands and over 99 percent of all 3 woods.

At KnuthGolf.com, an online fitting is conducted to properly address the loft for the driver and which weight and flex is needed for the club shaft for any High Heat fairway wood or hybrid they purchase.

ABOUT KNUTH GOLF

Dean Knuth, a former USGA Senior Director, designed High Heat metalwoods specifically with amateurs in mind. Amateur golfers need clubs that use discretionary weight to optimize their much different performance needs compared to Tour pros with 115+ swing speeds who consistently hit on or very near the center of the face.

Knuth Golf's High Heat driver, 3 wood and #3 hybrid have been named the best in their class by several golf media. The company will launch its #4-#7 hybrids and 5 wood at the PGA Merchandise Show in January.
